V2G GLOBAL ROADTRIP: AROUND THE WORLD IN 50 PROJECTS

Lessons learned from fifty international vehicle-to-grid projects.
READY FOR A CROSS-CONTINENTAL ADVENTURE?
A SUMMARY OF LANDMARK V2G PROJECTS FROM AROUND THE GLOBE.

Vehicle-to-grid (V2G) technology is booming. Across the world, pioneering V2G projects are delivering cutting-edge insights through learning by doing.

But whilst most projects have published individual outcomes, no one before has ventured to systematically capture lessons learned – and apply these to the UK and beyond. This is a problem. By focusing only on activity at home, we risk repeating mistakes that others have already learned; and we risk missing out on early successes too.

So this report is a round-the-world road trip of landmark V2G projects. It is jointly commissioned by leading network operator UK Power Networks and innovation agency Innovate UK, both at the forefront of V2G demonstration. It’s an ambitious exploration, made possible only through the pan-industry support from contributors, and the records of intrepid explorers who have charted part of the way with early comparative reviews.

Our goal is to equip Distribution System Operators (DSOs) and market participants with the latest intelligence on where the value of V2G lies and what the challenges are. Please join us: pack your bags and off we go!

Vehicle-to-grid (V2G): Technology enabling bi-directional energy transfer from/to plug-in electric vehicles. This is distinct from ‘dumb’ one-way charging and ‘V1G’ or ‘smart’ charging where the rate and time of charge can be varied. Potential of V1G is considered in literature elsewhere.

TABLE OF CONTENTS

EXECUTIVE SUMMARY

PART 1: MAPPING OUT OUR JOURNEY
Every good roadtrip begins with a plan. What projects are out there? We survey the literature and contact leading experts to form a definitive list.

PART 2: STOP-OFFS ON THE WAY
Right, so we’re off! Time to visit the must-see landmark projects! We showcase 10 and marvel at what’s been achieved, taking dashboard snapshots along the way.

PART 3: OUR JOURNAL
This time away has prompted some reflection. We log what we’ve learned – and the implications for the UK.

APPENDIX 1: PROJECT LIST
APPENDIX 2: SOURCES
As electric vehicle (EV) penetration increases, Distribution System Operators (DSOs) face new challenges in operating their networks. But with challenge comes opportunity. Vehicle-to-grid (V2G) technology enables bi-directional energy transfer from and to EVs, exploiting the storage potential of the batteries they contain. V2G promises to better integrate EVs whilst offering additional forms of flexibility at a local level.

Seeking to learn from wider experience on V2G, and maximise national innovation benefits, UK Power Networks and Innovate UK have together commissioned a global review of this technology.

This report is a round-the-world roadtrip of landmark V2G projects. We’ve ventured to equip DSOs and market participants with the latest global V2G intelligence and where the challenges lie.

**OUR JOURNEY**

1. Mapping the journey: Every good roadtrip begins with a plan. So we started with a grand mapping exercise – surveying the literature and contacting leading experts to form a definitive project list. Our criteria for inclusion was physical deployment of V2G technology for a specific use case. This excluded experimental research and narrow technology demonstration.

2. Stop-offs on the way: We scheduled ‘stop-offs’ with ten must-see landmark projects – holding interviews to understand the customer offer, service readiness and operational findings.

3. Our journal: All of this travel prompted reflection. We logged what we learned – and teased out the transferability to the UK.

It’s been an ambitious exploration, made possible only through the support of contributors on the way – for which we are very grateful. Here’s what we found.

---

**HALF OF PROJECTS ARE IN EUROPE**

There are 50 V2G projects globally, of which 25 are in Europe, 18 in North America, and 7 in Asia. Asian participation has been more focused on vehicle-to-home and vehicle-to-building (V2H/B) services and contributing as a manufacturing partner than deployment.

**SOCIAL ISSUES OFTEN OVERLOOKED**

Almost all projects had a technical element (98%). Few focused on social aspects (27%). This reflects the sector’s fledging status and early teething problems with V2G charger technology. Interviewees emphasised the need for greater focus on user behaviour going forward.

**RENAULT NISSAN MITSUBISHI DOMINATE MARKET**

Although 12 vehicle manufacturers (OEMs) have participated in V2G projects, Renault Nissan Mitsubishi clearly dominates. This arguably reflects the legacy of the Fukushima disaster, and the successful integration of V2G within the CHAdeMO protocol (see p10).

**DC SOLUTIONS DOMINATE**

DC solutions have dominated to date with DC chargers featured in 93% of projects. However there remains significant interest in AC with more AC compatible vehicles expected over the coming years.
EXECUTIVE SUMMARY

ONLY 10 V2G PROJECTS ARE PROVIDING DISTRIBUTION SERVICES – BUT UK DSOs CAN LEARN FROM V2G’S TRACK RECORD IN PROVIDING OTHER SERVICES

DISTRIBUTION SERVICES PROVIDED IN 10 PROJECTS

Services provided to Distribution System Operators (DSOs) are under-represented in global V2G projects – though this appears to reflect lack of DSO service maturity more than inherent V2G capability. Time-shifting and frequency response have been focus areas due to their high value.

10 LANDMARK PROJECTS ARE ESPECIALLY INTERESTING

1. Denmark, 2016 “Parker” World’s first fully commercial vehicle-to-grid hub: Nuvve
2. Germany, 2018 “Re-Distpatch” Unique redispatch approach: TenneT
3. Netherlands, 2014 “City-zen Smart City”, Innovative DSO services trial: Alliander
4. Netherlands, 2014 “Smart Solar Charging” Distinctive AC approach: LomboXnet
8. US, 2012 “JUMPSmart MAUI”, V2G via V2H with 80 chargers on island of Maui: Hitachi
9. US, 2017 “INVENT” 50 chargers with innovative EMS: Nuvve and UC San Diego
10. UK, 2018 “Network impact” DNO-led study of V2G network impact: Northern Powergrid

A Service Readiness Level (SRL) summarises the techno-commercial readiness of V2G systems to provide a particular service in the UK. From our review of projects globally, distribution-level services have a low SRL of 3. Lessons learned from higher SRLs for other services should help accelerate roll-out. However, a key difference with distribution services is the locational specificity required, which complicates the aggregate statistical approach taken to guarantee availability and performance.

V2G: GLOBAL ROADTRIP
EXECUTIVE SUMMARY

SO WHAT? LESSONS FROM OUR ROADTRIP

FOR NETWORK OPERATORS

1. ADAPT INTERCONNECTION STANDARDS & PROCESSES: The EV community does not expect special treatment. But along with other distributed energy providers – such as domestic demand-side response – it expects requirements and costs to be proportionate to asset size.

2. CLARIFY THE VALUE OF DSO SERVICES: Global projects have tended to focus on other non-DSO services only because the value and service specification of other services have, to date, been clearer.

3. DESIGN SERVICE SPECIFICATIONS WITH V2G IN MIND: in particular, consider the:
   i. response time required (with V2G able to provide a response within 2 seconds)
   ii. duration the service needs to be provided for (with a balance between power and length of service), and;
   iii. availability and performance levels provided by fundamentally less controllable assets.

FOR GOVERNMENT

Support and enable Network Operators and Industry to achieve the above, to unlock the potential of V2G

FOR INDUSTRY

4. MATURE THE HARDWARE: Few bidirectional chargers and vehicles (particularly AC) are commercially available at present, with performance challenges and high costs. A greater range and maturity of technology is expected in the coming years.

5. TARGET SERVICES WHERE V2G ADDS VALUE: Smart charging (V1G) is sufficient for many services. However, V2G offers unique value in these scenarios: (1) for services where location matters; (2) locations with surplus solar capacity; (3) markets with high peak pricing or charges; and/or (4) for longer duration services. Yet even here, V2G charger cost reduction is essential for economic viability.

6. SEGMENT USER BEHAVIOUR: Customers have typically been a secondary consideration to date. Yet customers are diverse (families, fleets, car-share schemes and/or school buses all featured in this review). This diversity aiding V2G and 24/7 service provision but means segmentation of customers is more useful than averages. Innovations should target mobility-as-service models.
INTRODUCTION

This report is commissioned as part of the TransPower portfolio, which explores vehicle-to-grid technology as one of several smart solutions capable of reducing reinforcement costs due to electric vehicle uptake.

The TransPower portfolio consists of UK Power Networks’ activities contributing to several Innovate UK vehicle-to-grid (V2G) competition projects. TransPower is funded by the Network Innovation Allowance.

Under TransPower, UK Power Networks is evaluating the technical, commercial and customer proposition of V2G technology to the distribution network. The portfolio will investigate network impact and flexibility services for several different vehicle customer segments from domestic, to commercial and public charging through demonstrator trials and collaborative research and development.

FORWORDS

Vehicle-to-grid (V2G) technology could potentially be one of the most important technological innovations to hit the electricity network since distributed renewable energy became commercially viable. It could eventually millions of mobile energy assets can be deployed in an instant to prop up local networks and contribute to the national transmission system.

Earlier this year Innovate UK announced a series of large-scale V2G demonstrator projects. UK Power Networks is part of consortia that won a total of £11 million for five different projects, from a trial of 1,000 V2G fleet vehicles to helping a bus garage in London become the country’s first clean green electric facility of its type. We have jointly commissioned this report, an international summary of V2G, to ensure that our activity is fully informed by lessons learned abroad.

The road to V2G isn’t going to be easy. Significant technical challenges remain. The cost of bi-directional chargers is still prohibitive. And with a nascent market, electricity networks need to move quickly to enable the potential to be realised.

Yet the government’s commitment to V2G demonstrator projects shows there is political will and strong interest from across the industry. The opportunity is waiting to be taken, the ambitious in the industry will reap the rewards.

The energy system is undergoing a pivotal change. Renewable generation is consistently increasing and demand loads are becoming active agents in the power system. Ubiquitous use of two way communication and closer interaction between assets and players on the grid will allow smarter interactions.

One thing seems certain – consumers will play a key role in driving the change as their energy needs for warmth, light, power and, increasingly, mobility change.

At InnovateUK, we’re excited about V2G’s potential role in this future energy system. We have been pleased to award funding to 21 vehicle-to-grid projects, to pay for research and design and development, with the aim of exploring and trialling both the technology itself and commercial opportunities. This represents almost £30 million in government funding.

Yet in order for us to effectively support businesses to develop and realise the potential of new ideas, it’s also important that we remain abreast of the wider global context. We hope that the findings of this report help inform innovation in the UK, learning lessons to boost productivity and economic growth.

Through such innovation, consumers will move from being on the edge of the energy system to being at its heart. Now that’s an exciting prospect indeed.
Every good roadtrip begins with a plan. What projects are out there? We survey the literature and contact leading experts to form a definitive list.
A LITERATURE REVIEW REVEALED 50 V2G PHYSICAL PROJECTS DELIVERING CLEAR USE CASES. EUROPE AND NORTH AMERICA ARE CLEAR HOTSPOTS OF ACTIVITY.

Before embarking on our road-the-world trip, we need to map out what’s out there. Through a combination of literature review, targeted discussions and LinkedIn promotion, we identified 50 projects that met the threshold criteria for inclusion. The literature review excluded 8 V2G demonstrator projects (and 13 research and feasibility studies) recently funded by Innovate UK, as documented in Appendix 1. A full project list is provided in Appendix 1, and sources logged in Appendix 2.

Our criteria for project inclusion in list was for projects to have physical deployment of V2G technology for a specific use case. The list excludes desk-based studies, experimental research and narrow technology demonstration.

Collecting detailed data on projects is challenging: This is in stark contrast to the often detailed data available for stationary storage projects on the global NREL database, and the data compilation on renewables projects conducted by Trade Associations.

Note: Details are based on a review of public domain sources; however, we note that these datapoints are not always clear, and it is common for a project’s number of chargers and trialled services to evolve over time.
Most projects have had a technical focus – with user behaviour only being explored more recently. Japanese OEMs have dominated the market.

There are 50 V2G projects globally, of which 25 are in Europe, 18 in North America, and 7 in Asia. In Europe, Northern European states dominate with the Netherlands, Denmark, UK and Germany the market leaders. Activity in the US is primarily in California, Hawaii and Delaware. Project data shows that Asian participation has been more focused on contributing as a manufacturing partner than being a home for deployment, with a few notable exceptions.

Renault Nissan Mitsubishi dominate the market. Although 12 vehicle manufacturers (OEMs) have participated in V2G projects, Renault Nissan Mitsubishi clearly dominate. This arguably reflects the legacy of the Fukushima disaster, and the successful integration of V2G within the CHAdeMO protocol (see p10).

Almost all projects had a technical element (98%). Few focused on social aspects (27%). This reflects the sector’s fledging status and early teething problems with V2G charger technology. Interviewees emphasised the need for greater focus on user behaviour going forward.

DC solutions have dominated to date with DC chargers featured in 93% of projects. However there remains significant interest in AC, with more AC compatible vehicles expected over the coming years.

Social issues are often overlooked.

Half of projects are in Europe:

- 50 V2G projects globally
  - 25 are in Europe (50%)
  - 18 are in North America (36%)
  - 7 are in Asia (14%)
V2G HAS BEEN TECHNICALLY DEMONSTRATED FOR OVER A DECADE. THE SECTOR’S CHALLENGE HAS BEEN IDENTIFYING A Viable COMMERCIAL MODEL

PRE 2012 – THE EARLY YEARS
- V2G was pioneered at the Uni of Delaware by Prof. Willett Kempton in 1990s, leading to the first real world test of frequency response with seven vehicles in the PJM* market in 2008.
- In 2011, the Fukushima disaster in Japan spurred Japanese OEMs and market participants to develop bidirectional capability. This led to the development of the CHAdeMO protocol and set the scene for the larger deployments to come.

2012–2015 MAJOR PROJECTS DEMONSTRATE TECHNICAL VIABILITY OF V2G IN RANGE OF MARKETS
- Grid to wheels project in US proves EVs can provide FR services to PJM*.
- JumpSMARTMaui installs 80 centrally-controlled V2H chargers, helping manage evening peaks on Maui
- German lighthouse project INEES demonstrates technical viability of V2G using 20 Volkswagen UP and 40 SMA bi-directional chargers
- Commercial LEAF to home service launched in Japan – over 4000 sold by 2017

2016 – 2018 SEARCH FOR THE RIGHT COMMERCIAL MODEL TO UNLOCK SCALE
- Since 2016 market searching for scalable commercial model.
- Viability has been hindered by a lack of competitive hardware
- Frequency response prices have declined in the UK reducing value available to V2G projects targeting this revenue stream
- One highlight has been Parker providing commercial frequency response in Denmark (although deployment in the Danish market has been limited by high taxes on EVs).

THE FUTURE!
- More chargers and more cars! The rise of AC?
- First commercial offers being announced in California and the UK
- Greater focus on DSO services as the value and service specification becomes clear
- Integration of V2G into broader mobility offers

FOOTNOTE: A number of V2G projects across Europe have scaled back on their ambitions on number of chargers. The reasons are multiple, including:
- Technical: Technical teething problems in Phase I deployment, e.g. bugs with chargers, leading to budget reallocations.
- Economic: Prohibitive high cost of chargers, and diminishing returns to learning from deploying more (uncompetitive) chargers.
- Social: Challenges in securing customers willing to participate in scheme

*PJM is a regional transmission organization (RTO) in the USA that coordinates the movement of wholesale electricity in all or parts of 13 states and the District of Columbia

IN ADDITION TO IDENTIFYING PROJECTS, WE DEVELOPED THREE METRICS OF READINESS LEVEL TO ASSESS GLOBAL V2G TRACK RECORD

PROJECT GOAL
To help assess the techno-commercial readiness of V2G systems to provide various services in the UK we have developed three indicators of maturity, called ‘readiness levels’. The readiness levels reviewed are:

- **Technology Readiness**: focused specifically at chargepoint technology
- **Market Readiness**: focused on the openness of the market reviewed to V2G.
- **Service Readiness**: focused on the ability of V2G to provide a specific system service

Each is now discussed in more detail.

**Technology Readiness Level (TRL)**

TRL is a tool developed by NASA and used by a range of other organisations (e.g. European Commission) for monitoring technology support from basic research through to system demonstration for a range of conditions, and is commonly applied in the innovation space. In this report, we use TRL to describe the maturity of V2G chargepoint technology.

</tbody>
</table>

**Service Readiness Level (SRL)**

We have adapted the TRL metric into a Service Readiness Level for the UK as follows:

- **FEASIBLE**: Service theoretically feasible
- **TESTED/TESTING**: Demonstrated that system can technically provide the service (i.e. proof of concept trial)
- **PROVEN**: Demonstrated in small-scale commercial trial (most likely with Gov. support and funding)
- **COMMERCIAL ANYWHERE**: Service being procured commercially from V2G, in any market not necessarily similar or applicable to the UK
- **COMMERCIAL (SIMILAR TO UK)**: Service being procured commercially from V2G in market that is not vertically integrated
- **COMMERCIAL COMPETITION**: Service being procured commercially from V2G in market that is not vertically integrated, with some degree of competition from V2G providers

**Market Readiness Level (MRL)**

A country’s procurement readiness for V2G, focusing on the openness of demand response markets from distributed assets, including any regulatory barriers.

</tbody>
</table>
Right, so we’re off! Time to see the must-see landmark projects! We shortlist 10 showcase projects and marvel at what’s been achieved, taking Dashboard Snapshots along the way.
WE SELECTED 10 LANDMARK PROJECTS FOR DETAILED REVIEW ON OUR GLOBAL V2G ROADTRIP. THESE ARE FEATURED ON THE FOLLOWING SLIDES.

1. PICKING OUR LANDMARK PROJECTS
The projects on the following 10 slides have been shortlisted as landmark must-see projects, based on the following criteria:
- Focus on DSO services (where possible)
- Breadth of customer offer and geography
- Project maturity, with a preference for projects where clear learnings and direction for future development and implementation can be extracted
- Applicability to UK.

2. DEVELOPING DASHBOARDS
We developed Project dashboards to enable systematic comparison of projects. They were populated based on literature review and following targeted interviews with project representatives.
The table below characterises the services provided by V2G systems, in a way that strikes a balance between standardisation and presenting market-specific features.

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>DEFINITION</th>
<th>OPTIONS</th>
</tr>
</thead>
</table>
| Beneficiary    | The party that benefits from the service.                                   | ▪ TSO: Transmission System Operator  
▪ DSO: Distribution System Operator  
▪ TPI: Third Party Intermediary (an actor participating in energy markets)  
▪ Consumer: Onsite energy consumer, behind-the-meter                                                                                                                                                     |
| Service        | A defined technical product provided to System Operators, Networks Operators, utilities or consumers | ▪ Frequency response – fast acting service seeking to keep system frequency within specified limits  
▪ Reserve – slower acting service provided over a longer duration  
▪ Arbitrage – buying energy at low prices and selling at high prices  
▪ Distribution services – services to the DNO or DSO, typically involving constraint management or voltage control  
▪ Time shifting for energy users – shifting when customers use energy thereby reducing charges and/or increasing self consumption                                                                                                                                 |
| V2G            | Type of service provided                                                    | ▪ V2G: Vehicle-to-grid. Vehicle provide services to regional network or national system  
▪ V2B: Vehicle-to-building. Vehicles are integrated into (non-residential) building energy management, providing behind the meter services  
▪ V2H: Vehicle to home. Vehicle provides services to home with chargers behind the meter  
▪ V1G: commonly referred to as ‘Smart Charging’, the vehicle only supports uni-directional charging (no exports) and provide services by altering its charging load.                                                                 |
| When to act    | When service is provided                                                    | ▪ Pre-fault: before a fault is experienced on a system, for instance frequency response with a tight trigger frequency  
▪ Post-fault: after a fault has occurred                                                                                                                                                                       |
| Triggering Action | The mechanism through which a response is triggered                      | ▪ Grid frequency: e.g. frequency hits set threshold such as 49.9Hz  
▪ Back office control signal: e.g. event beneficiary sends signal to vehicle that triggers a response  
▪ Other local signal: to be defined  
▪ N/A – scheduled: Service is contracted to commence at a pre-agreed time                                                                                                                                 |
| Response speed | The time to provide full response after receiving trigger                  | Subject to service specification but typically:  
▪ Seconds for frequency response  
▪ Minutes for reserve  
▪ N/A - scheduled                                                                                                                                                                                            |
| Duration of service | For how long service is required                                        | Subject to service specification but typically:  
▪ < 1 hour for frequency response  
▪ Minutes to hours for reserve  
▪ 1-4 hours for peak shaving & constraint management                                                                                                                                                     |
**2016-18 PARKER**

Landmark commercial deployment of V2G in Danish frequency response market – engaging multiple fleets, vehicles & locations.

**PROJECTS VALUE**
DKK 14,731,471 (funded by ForskEL)

**CUSTOMER SNAPSHOT**

**OPERATIONAL SNAPSHOT**

**USER BEHAVIOUR**
Every fleet is different. Customers have access to app on phone to indicate what state of charge they would need at what point in the day. Some users don’t want to use the app, so then a schedule is put in for them. Important to understand customer schedule.

**AVAILABILITY & PERFORMANCE**
Different vehicles tested and show different performance levels. Technical barriers included:
1) long duration freq. rebids – service required often exceeded kWh capacity requiring lower kW bids
2) two way energy loss - (discharging at power levels lower than the rating of the charging equipment can result in low efficiency and high losses. Efficiency of 90%+ expected in future.
3) battery degradation impact (see INVENT slide for further details)

**SERVICE**
Frequency containment
Constraint management
Trading on day-ahead / intraday
Price differential
Bid / offer accepted

**BATTERY USAGE FOR V2G**: 30% to 95%

**Customer offer**
Monthly fee which includes charger

**PARTICIPATION**

- NUVVE (Aggregator), DTU Elektro/PowerLabDK (Research), Nissan, Groupe PSA, Mitsubishi Motors (Car OEMs), Insero (Other), Frederiksberg Forsyning (Host and Fleet), Energi (Charger), Mitsubishi Corp (Tech)
- Frederiksberg Forsyning during day and parked overnight and weekends. Other locations include municipalities, commercial companies and ports.

- 24/7 service provided to Energinet. Utility vehicles used by Frederiksberg Forsyning during day and parked overnight and weekends.

**MARKET**
High energy tariffs and taxes, including double counting

**Emergency response**

- Frequency containment
- Trading on day-ahead / intraday

**ARCHITECTURE**

- App informs Nuvve of drivers’ preferences and charge required. This resource is then matched to grid and market signals to provide service.
- For V2G CHAdeMO protocol is being used.

**V2G**
When to act:
- TRIGGERING ACTION:
- RESPONSE SPEED:
- DURATION OF SERVICE:
- STATUS:

**TRIGGERING ACTION**

- Frequency containment
- Constraint management
- Trading on day-ahead / intraday

**MOTIVATION**

- Service provision
- Technical capabilities
- Commercial viability

**SOCIAL**

- User behaviour
- App informs Nuvve of drivers’ preferences and charge required. This resource is then matched to grid and market signals to provide service.

**TECHNOLOGY**

- Battery usage for V2G: 30% to 95%
- Different vehicles tested and show different performance levels.

**BENEFICIARY**

- Mobility-as-service offer – a fee per month which provides charger and maintenance and tools to manage charging.
- V2G is used to reduce charging cost for consumers, with FR revenues reducing costs paid.

**PARKER WEBPAGE**

*We are celebrating our second full year of providing frequency response to the Danish TSO*

- Marc Trahand, nuvve
**REDISPATCH V2G**

Virtual renewable power transport through V2G: reducing transmission constraints & deferring network investment

**2018-21**

Demonstration project proving technical ability to use TSO's own field service fleet in addressing transmission constraints in Germany. Highly distributed chargepoint locations. Chargers installed; comms protocol under development

**PARTNERS**
- TenneT TSO
- The Mobility House EMS
- Nissan Car OEM

**BATTERY USAGE FOR V2G**

Permission from Nissan to drop State of Charge (SoC) to 35%

**ARCHITECTURE**

The Mobility House (TMH) provide load and energy management software, communication & control technology. TMH bundles V2G assets together and continuously reports availability (kWhs) to TSO. TenneT sends a request to TMH, which can be accepted or rejected. One key objective to maximise comms system learning through utilising multiple distributed locations.

**OPERATIONAL SNAPSHOT**

</tbody>
</table>

Field service fleet is expected to provide mobility services in a relatively routine, scheduled manner during standard working hours. Assets will be plugged in and available overnight.

Potential commercial value is very high. In 2017, 5.5TWh of renewables was curtailed in Germany, at a cost of €1.4bn. Network upgrades to manage this could cost €18bn. 5.5TWh could charge ~2m EVs for one year.

Constraints are most severe in the north (originating in wind plant), though solar-driven constraints are emerging as a challenge in the south.

**MESSAGE**

"Let’s simplify regulations for distributed assets”
- Marcus Fendt, The Mobility House
2014-19

CITY-ZEN

Small-scale commercial trial of DSO service, engaging diverse customers: commercial, individual & car-sharing

Dutch project with 4DC V2G chargers – with pioneering focus on DSO services. Adopting a holistic commercial, social and technical approach, with multiple power sector use cases.

PARTNERS
- ALLIANDER
- NEWMOTION
- ENERVALIS
- MAGNUM CAP

PROJECT VALUE
€300k for equip. + subsidised labour.

SERVICE Provision

PROJECT FOCUS
1. TECHNICAL
2. COMMERCIAL
3. SOCIAL

SERVICE provision

DSO
- Constraint management & Power quality
- V2G
- Pre-fault
- Forecast on USEF platform
- Within minutes/hours
- Testing ongoing

TPI
- Imbalance and energy trading
- V2G
- During market peak/troughs
- Settlement Period – 15 mins
- Testing ongoing

CHARGING POINT
- 4 DC V2G chargers, 10 kW, MagnumCap

CUSTOMER OFFER
Customers paid flat rate of 10 Euro cents/hour of plug-in time (subsidised by public funding)

CUSTOMER SNAPSHOT

User Behaviour
Commercial customer well-engaged; this is believed to partly be due to their strong green credentials at management level and emphasis on resilience, and maximising PV self-consumption.

Payment of 10Eur cent/hr helps engagement but is subsidised; concerns if payment is at (lower) market rates.

SEGMENT HOUSEHOLD & COMMERCIAL

CHARGE POINT

VEHICLE
- 2 Mitsubishi Outlander, 2 Nissan LEAF

OPERATIONAL SNAPSHOT

BATTERY USAGE FOR V2G:
Minimum SoC of 20-30%. When car arrives at chargepoint, immediately bring down to 45% SoC.

ARCHITECTURE
Project adopts the Universal Smart Energy Framework (USEF) platform. All stakeholders can access forecast system needs day-ahead, hour-ahead or on the spot.

AVAILABILITY & PERFORMANCE
Pleased with response time; only marginally slower than stationary batteries. Biggest challenge was with availability of assets for usage (i.e. plug-in time plus appropriate State of Charge - SoC). This was particularly problematic given the small scale of the pilot (4 chargers), meaning that during some periods, storage was not available.

“If we can engage customers with V2G, it is expected to create new revenue opportunities. Barriers include legacy solar subsidy regimes and under grid acceptance standards”

- Marisca Zweistra, Alliander

- CHARGE POINT
  - AC 22 kW
  - By Seers Group & The People Group (GR in past)
- VEHICLE
  - 22 Renault Zoe (40kWh)
- CUSTOMER OFFER
  - Part of car sharing scheme – EUR 99/month. Includes km and insurance

OPERATIONAL SNAPSHOT

- USBERTY
- PROJECT WEBPAGE

"We are developing a scalable system to facilitate the rollout of EV charging and solar power with an AC standard."
- Robin Berg, Lomboxnet

BATTERY USAGE FOR V2G:
Small amount (%) of battery is used. Maybe more later if results show that degradation is small.

USER BEHAVIOUR

Insights expected at end of 2019

With present amount (22) of 22 kW unidirectional charging stations we see on average:
- 10% occupied and charging;
- 50% occupied and NOT charging

ARCHITECTURE

Public charge points (directly connected to the low voltage grid) in a neighbourhood with high uptake of solar energy.

V2G services will be delivered through USEF framework

AVAILABILITY & PERFORMANCE

Insights expected at end of 2019

End 2018 the first prototypes of the Renault Zoe car with bidirectional capabilities will arrive in Utrecht. Testing will start in 2019. Results are expected at the end of 2019

DSO is engaging proactively with V2G, and this is expected to create new revenue opportunities. Barriers include legacy solar subsidy regime, and unclear grid acceptance requirements. Dutch grid is not ready for storage.
**GRID MOTION**

Large scale, privately funded demonstration of V1G and V2G – targeting frequency response, arbitrage and more

**PARTNERS**
- Groupe PSA: Car OEM
- Direct Energie: Market access
- Enel: Charger
- Nuve: Aggregator
- Proxiserve: Installation
- DTU: Research

**PROJECT VALUE**
- PRIVATELY FUNDED

**SERVICE PROVIDER**
- **TSO**: Frequency Response, V2G, Pre-fault, Grid frequency
- **TPI**: Trading on day-ahead / intraday, Price differential - Bid/Offer called, < 15 minutes, 15 min blocks
- **ENERGY USER**: Reduction Time of Use Charges, V2H

**CUSTOMER SNAPSHOT**
- **PROJECT**: Developed as the first V2G project established in France. V2G chargers installed with a commercial fleet and V1G at consumer homes. The study is key to demonstrate feasibility commercially to project participants and to break down barriers for market access of DERs in France.
- **SEGMENT**: Commercial fleet on airport grounds (airport supplier)
- **CHARGE POINT**: V2G - Enel 10 kW DC, V1G is using bidirectional Nuve 18 kW AC chargers
- **VEHICLE**: 15 Peugeot iOn or Citroen C-ZERO
- **CUSTOMER OFFER**: Free charger

**OPERATIONAL SNAPSHOT**
- **USER BEHAVIOUR**: Too early in project to provide learning
- **ARCHITECTURE**: App informs Nuve of drivers’ preferences and charge required. This resource is then matched to grid and market signals to provide service.
- **AVAILABILITY & PERFORMANCE**: Battery min/max usage is dependent on specific model of car.

**SERVICE READINESS LEVEL FRANCE**
- **SERVICE**: 1
- **TECHNOLOGY**: 9
- **MARKET**: 9

**DISCUSSION**
- "We need more efficient interconnection standards" - Paige Mullen, Nuve

**MARKET**
- DSR market well developed. Market is not vertically integrated. Regulatory barriers exist relating to introduction of diverse, distribution level kW-scale resource i.e., minimum participation limits to trade and access frequency market and users cannot sell energy.
KEPCO project laying technical groundwork for EV roll out in Korea

2015-17

KOREAN V2G

Project is part of a broader Vehicle Grid Integration programme seeking to smooth roll out of EVs in Korea. V2G work has focused on development of bidirectional DC chargers and interface protocol, with tested testing various chargers. Hyundai Mobis were first to have bidirectional charger approved.

**PARTNERS**

- KEPCO: Lead

- CUSTOMER OFFER Mitsubishi Motors’ employees selected, to simplify consumer engagement.

**PROJECT FOCUS**

1. TECHNICAL

**BATTERY USAGE FOR V2G**: not stated.

**OPERATIONAL SNAPSHOT**

**USER BEHAVIOUR**

- 5 drivers using the vehicles ‘normally’, typically plugging in when arriving at work.
- Leaving time is entered by employees to indicate time window for V2B services.

**AVAILABILITY & PERFORMANCE**

- 30-50kWh/day discharged for the peak hours (1-4pm) from the EVs and the used batteries to the facilities.
- Shaved peaks by 12.7% on average.
- No performance issues over 1 year period. No noticeable impact on battery degradation.

**MARKET**

- MV uptake still low, so difficult market. Market is undergoing liberalisation. V2B achievable, but V2G faces substantial barriers

---

“We proved the technical feasibility of vehicle-to-building five years ago. The next challenge is economics”

- Project representative, Mitsubishi Corp.
Deployed 80 V2H chargers which demonstrated discharge in response to grid signals over the 6-9pm peak period, thereby helping manage distribution system loads and frequency events.

The project was part of major broader smart grid project seeking to integrate renewable energy, electric vehicles, energy storage, and controllable loads in Maui, Hawaii.

**SERVICE PROVISION**

*Service provided in the demonstration project led by Hawaiian Electric that followed JUMPSmartMaui*

**PERFORMANCE**

- **Peak reduction**
  - Yes through peak reduction at homes
  - Forecast based on system req.
  - Backoffice control signal
  - < 4 secs
  - 3 hours (6-9pm)

- Unknown

**PARTNERS**

- HITACHI
  - Lead
- NEDO
  - Founder
- Mauna Kea Bank and Cyber Defense Institute, the State of Hawaii; the County of Maui; Maui Electric Company; Hawaiian Electric Company; Hawaii Natural Energy Institute; Maui Economic Development Board Inc.; University of Hawaii Maui College

**BATTERY USAGE FOR V2G:**

- 30 – 95%

**OPERATIONAL SNAPSHOT**

- **USER BEHAVIOUR**
  - 80 families using the vehicles ‘normally’, typically plugging in on return from work.
  - This meant limited diversity and restricted when V2G could be provided.
  - Families often used other DC fast chargers, which meant only plugged in on average every other day.
  - Trial ran in 2013-2014 with V1G which made it easier to introduce V2G as good data on driving patterns had already been recorded.

- **ARCHITECTURE**
  - Energy control via autonomous, decentralized system. Hitachi developed integrated Demand Management System (DMS), with localised autonomous DMS. EV charging utilised these DMS with EV Control Centre to create a charging schedule so as to fill up the gap between the estimated power generated by renewable energy and load of the next day. It then takes account of each EV’s connection status to the normal charger and the desired charge end time to instruct the charge start time to each EV. ChiDoMe protocol used.

- **AVAILABILITY & PERFORMANCE**
  - Export limited to 1kW, although 6kW modelled. Interconnection standards were onerous and Hawaii specific. (These have now been replaced with US-wide UL certificate which is helpful). Forecast of vehicle behaviour in aggregate was challenging.
  - Hawaiian electric have now revised demand response programme. V2G not directly included but V2H as a form of DR will be eligible. Bidding underway for delivery late 18/19. EVs are very fast and flexible and when combined with other resources can be very valuable to grid.

**PROJECT WEBPAGE**

---

"We delivered V2G at scale...from real world families we had no control over”

- Project representative, Hitachi

---
**SERVICES PROVISION**

### TSO / DSO
- **Demand Response / Peak reduction**
  - V2G
  - Stress event called by TSO/DSO
  - Stress event called by TSO/DSO
  - Alerts usually issued day ahead
- **Frequency regulation**
  - V2G
  - Continuous response to signal
  - Grid frequency (AGC signal)
- **Energy Users**
  - Reduction of demand charges
  - V2H/IB (although can be stacked)
  - Peak charge periods (kW)
  - Approach of unusual load peak
  - 15-min intervals
  - Hours

### TSO
- **Demand Response / Peak reduction**
  - V2G
  - Stress event called by TSO/DSO
  - Stress event called by TSO/DSO
  - Alerts usually issued day ahead
- **Frequency regulation**
  - V2G
  - Continuous response to signal
  - Grid frequency (AGC signal)
  - < 4 seconds
  - Continuous
- **Energy Users**
  - Reduction of demand charges
  - V2H/IB (although can be stacked)
  - Peak charge periods (kW)
  - Approach of unusual load peak
  - 15-min intervals
  - Hours

### ENERGY USERS
- **Participation**
  - Proven
  - Tested

**CUSTOMER OFFER**
- Predominantly workplace charging during day, with university fleet charging at night.
- Free charger, parking and electricity

**ARCHITECTURE**
- Nuvee GIV™ aggregation platform.
- Exploring interaction with advanced solar forecasting, integration with building energy management systems and response to TSO & DSO-level demand response markets.
- Platform has been providing frequency regulation to TSOs since 2009.

**BATTERY USAGE FOR V2G: OEM and model dependent**
- Challenges are: 1) Availability of cars 2) EVSE reliability 3) Adapting system to local requirements, 4) Market Access Paths 5) Battery Degradation – V2G does cause some additional degradation but much smaller than that experienced through driving behaviour (and particularly regenerative braking). Potential damage depends on service, with full charge/discharge cycles being the worst. Car manufacturers may move towards certifications to make it a requirement to be an approved aggregator or charger.

**SERVICE TECHNOLOGY**
- AC chargers UL listed and commercially available DC chargers have been operated thoroughly in testing environment and commercially available.

**MARKET**
- Value streams available in DSO and TSO level demand response markets and behind-the-meter applications (V2B). Current barriers to TSO frequency regulation market. Key market barriers include quickly evolving interconnection standards for inverters, market access options for electric vehicles and compensation mechanisms between retail and wholesaler.

  DURATION OF SERVICE
  STATUS

SERVICE READINESS LEVEL

- SERVICE: 2
- TECHNOLOGY: Chargepoint has been demonstrated in operational environment
- MARKET: High – active demand response market, supportive TSO and DSO environment, strong competition between aggregators. However interconnection process is slow.

OPERATIONAL SNAPSHOT

- BATTERY USAGE FOR V2G: tbc but assumed to be 35-95%

- USER BEHAVIOUR
  Too early to say

- ARCHITECTURE
  Dispatched via Nuvve’s aggregator platform.
  Control input will be determined by the service that they are seeking to test.

- AVAILABILITY & PERFORMANCE
  Interconnection process in UK (G59 and 83 currently) is one of most complicated globally, taking ~6 months to connect due to requirement to undertake network impact assessment. This project will seek to make recommendations to streamline this process, most likely through type certification.

CUSTOMER SNAPSHOT

- SEGMENT: COMMERCIAL (NPG fleet)
- CHARGING LOCATION: WORK (NPG offices)
- VEHICLE: Nissan NV200s and possible Nissan LEAFs
- CUSTOMER OFFER: Given fleet vehicles of NPG, customer offer has not been major focus.

PLUG-IN TIME

- 0hrs
- 24hrs

“Through this project we hope to gain the evidence to streamline the interconnection process in the UK”
- Paige Mullen, Nuvve
This time away has prompted some reflection. We log what we’ve learned – and the implications for the UK.
THERE ARE ONGOING UK REFORMS ON MULTIPLE FRONTS (GOV’T, REGULATOR, SYSTEM AND NETWORK OPERATORS) TO ADDRESS V2G TECH & MARKET BARRIERS

NORTHERN IRELAND
The observations on this page largely refer to England, Wales & Scotland only. The market and regulatory context in Northern Ireland (NI) is distinct from that in GB, due to collaboration across the Island of Ireland. For instance, the procurement of system services in NI is run jointly with the Rol under the DS3 programme.

UK CONTEXT
So, we’ve mapped out V2G projects globally and visited ten landmark projects: there’s plenty to log in our Journal and bring back home. But before we can tease out the lessons learned for the UK, we need to be aware of UK-specific market conditions.

The UK benefits from important commitment from government, the regulator, system operators and network operators to remove barriers to entry to V2G roll-out.

The chart on the right summarises some notable features of the market landscape. Its purpose is not to be comprehensive, since a detailed market review would constitute a report in itself*. Instead, the purpose is to prime our analysis covered on the following pages.

*NSee Cenex report listed in Appendix 2.
EVs can provide fast and flexible bidirectional energy flow, yet the hardware remains commercially immature.

**Our Journal**

Just as the development of V2G is on a journey from purely technical studies and demonstrator trials through to widespread commercial deployment to a large number of customers; this journal follows the same path. We begin with the lessons learned for technical aspects, primarily focused on the hardware itself. We then consider the critical interface between technical and regulatory issues, before looking at commercial models. We consider insights into potential V2G customers before concluding with where V2G can add unique value. In all of the above we consider key learnings for the UK sector.

**Technical continued.**

Efficiency losses – The Parker project found that efficiency losses were significant when discharging at a rate lower than the rated power of the equipment.

AC / DC debate is live. DC ChaDeMo solutions dominate the market at present but there is significant interest in AC solutions (Smart Solar Charging, INVENT, Kepco).

The marginal degradation cost of V2G activities should be considered: However, the magnitude of this degradation cost appears much smaller than that caused by differences in driving behaviour (and particularly regenerative braking). Potential damage depends on the nature of the service, with full charge/discharge cycles being the worst. Car manufacturers may move towards certifications to make it a requirement to be an approved aggregator or charger.

Make slow starters mandatory: A key finding of the City-zen project (Amsterdam) is that it is crucial to ensure that grid stability does not interfere with the charger. Having incurred problems with this early in their project, the City-zen team recommend that grid acceptance standards are amended to make it mandatory for ‘slow starters’ to be incorporated into all V2G chargers. Slow starters limit the inrush of voltage, making the power quality more stable. The cost of incorporating this technology is reported to be low.

**Learnings for the UK**

- Support hardware development*
- Be flexible on AC/DC
- Consider slow-start charging technology

*Current Innovate UK focus area.
REGULATIONS NEED TO BE ADAPTED FOR A DECENTRALISED, BEHIND-THE-METER AND INHERENTLY LESS CONTROLLABLE SET OF ASSETS.

REGULATION

The energy system is heavily regulated – and this regulation is not well suited to flexibility assets which are decentralised, behind-the-meter and less controllable. Specific examples include:

Interconnection standards

- Onerous interconnection requirements were repeatedly flagged in interviews (Grid Motion, France; JumpSMARTMAui, USA; Parker, Denmark). As an example, in Denmark nuvve were initially given an 89 page wind farm connection guide!
- A key challenge for providers is that interconnection standards are country-specific, meaning the system has to be adapted every time.
- The EV community does not expect special treatment. But along with other distributed energy providers – such as domestic demand-side response – it expects requirements to be proportional to asset size.
- The interconnection process in the UK (G59 and G83 currently) is one of the most complicated globally, taking ~6 months to connect due to requirement to undertake a network impact assessment. The NPG project seeks to make recommendations to the ENA to help streamline this process. This would put the UK at the forefront globally.

Energy charges and settlement

- High cost of settlement meters: To demonstrate that an asset has provided a service, settlement meters are required. Different meters are often required for different services and these meters are often designed for much larger utility scale assets. This means proportionally high costs for V2G providers.
- Double-charging: In Germany V2G flexibility providers must pay energy levies on both production and consumption as storage is not yet a separate regulatory entity. This is also an issue in Netherlands and Denmark. The UK is more advanced in this area with Ofgem making various regulatory changes including adding storage as specific term within electricity licenses.
- System services: energy tariffs are lower when providing a system service. This leads to the challenge of ‘baselining’ or distinguishing between imports that are used to charge the car for mobility, and those imports used by the car to provide a service. In the UK, NGET’s Power Responsive goes some way to addressing this (though not fully).

Service specifications are particularly important and need to be defined with this technology class in mind. Three specifications emerge as crucial:

1. Response time – although EVs can respond rapidly (<2 secs), stand alone batteries are currently faster. Implementation of slow-start charger technology (see previous page) could slow EV response time further.
2. Duration - The Parker project noted that the amount of power that could be bid in as a service often had to be less than the charger capacity to ensure that the vehicle could provide a service over the full duration defined within the service specification. Reducing the duration could therefore allow a greater power response to be provided. To fully access the potential EV resource, service specifications need to be better aligned with what can be delivered or aggregators need to blend with other resources.
3. Availability – DSOs are used to their assets (grid infrastructure) providing extremely high levels of reliability (99.9%). This is challenging if EVs are to play a significant role in deferring grid reinforcement or expansion costs. Availability and performance issues need to be carefully considered within service and contract specifications for such works.

LEARNINGS FOR THE UK

- Use NPG project to streamline interconnection process
- Design service specifications with V2G in mind, in particular response time (current min of 2 secs), duration (linked to power requirements) and availability
**Commercial**

V2G provision of DSO services are underrepresented globally with 10 projects exploring DSO services. Projects have generally focused on time-shifting and/or frequency response due to the higher value available.

This appears to reflect lack of DSO service maturity more than inherent V2G capability. Interviews suggest that the reason why DSO services have been overlooked is that to date (a) the market value is unclear and (b) the service specification and route to market are not normally well understood.

As a result, DSO services currently have a relatively low SRL of 3. The SRL summarises the techno-commercial readiness of V2G systems to provide a particular service in the UK. An SRL of 3 means DSO services have been proven (in the SmartMAUI project in the US), with testing ongoing in the UK (NPG) and Netherlands (City-zen project). Also notable is the Re-dispatch project in Germany which is providing constraint management, albeit to the TSO. An SRL of 4 is in sight with tenders expected in Hawaii towards the end of this year.

V2G DSO services can benefit from developments on other services. The Parker project in Denmark demonstrates that V2G can provide a commercial service while meeting demanding technical standards for speed of response, availability and performance.

Location is more of a priority for DSO services. Frequency response is location agnostic, while DSO Services are location specific. This is both an opportunity and a challenge for V2G – an opportunity as there are likely to be vehicles in almost all locations; a challenge as there will only ever be a limited number of vehicles within a specific area making a statistical approach to forecasting difficult. This suggests a key role for aggregators in blending assets to reduce availability risk. V2G providers are also likely to have significant amounts of data that could help DSOs manage their network.

DSO services and V2G therefore have potential to mature together.

### LEARNINGS FOR THE UK

*Multiple selections permitted  **Full definition of SRL on page 11  ***For energy users
A big question is around lowest min SoC acceptable to users (How low can you go?). The answer is determined by both user acceptance and battery warranties. This review has suggested that vehicles are typically managed within the 25-95% SoC range, although this is vehicle and service dependent. It is less clear how comfortable customers are with this.

Car-sharing helps dodge the dual consumer concern of range and battery degradation. The City-zen project (Amsterdam) has engaged a car-sharing company, with good results. The downside is lower plug-in time compared with individually owned vehicles. Plug-in time is hugely variable; however, the project’s experience has been that the shared car’s plug-in time at the V2G charger is ~60%, though they believe that this might be increased with greater V2G charger availability.

This raises the bigger question of how V2G fits in with the future of mobility. From leased vehicles, to car sharing, to electric vehicles and, in due course, to autonomous vehicles, mobility is undergoing a profound transformation. The most advanced projects are part of this trend. For instance, Smart Solar Charging and City-zen are focused on car-sharing schemes, while in Denmark Nuvve are using V2G to reduce the monthly fee paid by customers for all of their mobility needs.

CUSTOMERS

Our global review shows social considerations typically come second in V2G project activity. This is a problem given that V2G potential depends on user acceptance, with drivers defining the constraints which V2G providers work within. A lack of focus on user acceptance is also noted within academic literature [Sovacool et al, 2018].

Consumer types and mobility behaviours are diverse. Project dashboards covered a range of customers including families, fleets and car-share schemes, even school busses for three US-based projects. Each customer will have their own mobility patterns and behaviours that need to be clearly understood. Averages will only tell part of the story with segmentation more useful.

This diversity adds value to V2G. In Denmark, the Parker project has been able to achieve 24/7 response only through diversity in the types of commercial fleets contracted (e.g. utility vehicles, port vehicles, municipality vehicles). Similarly JumpSMARTMaui noted that they could only provide frequency response during evenings due to the specific customer category.

Data is important. On the JumpSMARTMaui project, Hitachi had two years of V1G trial data on driving pattern data at an individual household level which made it easier to subsequently introduce V2G. This project also flagged the importance of understanding other charging options locally, with families having the option of using DC fast chargers locally, meaning they only plugged in at home every other day on average.

But, Warning! Consumers do not always behave how you expect. The customers are real people who take unplanned trips, may have vehicles that break, or are crashed into. They may not want to always connect their EV when at home or at work, with plug-in times typically lower than parking times. This is a real challenge. Mitigations include close to real time bidding of services, some allowance for lower availability and / or aggregation with other assets.

LEARNINGS FOR THE UK

- Embrace diversity in consumer types, data will help
- Integrate V2G into mobility-as-a-service schemes (e.g. car rental or sharing schemes etc.)
- Address social considerations for future projects, within the context of broader changes in mobility.
V2G CAN ADD UNIQUE VALUE, PARTICULARLY AS PART OF BLENDED ASSETS. BUT PROPORTIONATE STANDARDS AND CHARGER COST REDUCTION ARE NEEDED

UNIQUE VALUE OF V2G

Many of the services in this report can also be provided by smart charging (V1G). A key challenge for V2G is how and when it can add unique value over and above V1G. This review has identified the following as key areas of added value:

▪ **Services where location matters.** The Redispatch project in Germany is seeking to manage transmission constraints across the country. This is managed through seeking different service profiles from the highly distributed V2G fleet depending on the location.

▪ **Locations with surplus solar capacity.** V2G is a useful complement to solar at a range of scales. For instance at a site level, V2G can help increase local consumption at near solar projects, with export from vehicles if a building is able to use the additional power. At a system level, V2G can help manage the ‘duck curve’ issue so prevalent in California (and potentially an issue in the UK in due course), with vehicles managing the morning to midday solar ramp-up through charging, and evening solar ramp-down through discharging. This helps explain why INVENT, City-zen and Smart Solar Charging are so focused on the interaction with solar. However, legacy solar subsidies can make this difficult (i.e. as seen via the City-zen project).

▪ **High time of use or peak import tariffs.** In areas with significant time of use or peak charges, V2G can make a significant impact. This is a key focus of nuve’s commercial offer in California.

▪ **Longer-duration services.** Smart charging can only provide frequency response for the period of time when the vehicle is charging. In contrast, due to its bi-directional nature, V2G can provide frequency response until the point at which the SoC needs to be returned to the required level for the customer. Naturally this depends on flexibility within the service specification to allow management of state of charge for any periods of sustained asymmetric frequency behaviour. Previous studies by nuve suggest revenue from V2G can be a multiple of 8-15x that from V1G for provision of frequency response services.

But even in these scenarios, economic viability will only be achieved when wider economic conditions are met:

▪ **Pilots essential to achieve scale:** Large scale demonstration projects are needed to unlock markets. This bodes well for the UK given 8 demonstration projects funded by Innovate UK (see Appendix 1).

▪ **Proportionate interconnection standards:** These must be appropriate for these diverse, distributed and less controllable assets.

▪ **Charger cost reduction essential:** Representatives of M-tech Labo (Nagoya) emphasise that economical feasibility of V2G ‘needs further penetration of EV, cost reduction of V2X chargers and standardization.’ Bi-directional chargers are not yet mass-scale products. This clearly limits the ability to achieve scale.

Finally it is important **not to consider V2G in isolation.** In practice V2G will be blended with a range of other assets such as demand side response and batteries. As Hitachi note: ‘EVs are very fast and flexible, and when combined with other resources, can be very valuable to the grid’

LEARNINGS FOR THE UK

▪ **Focus on when and where V2G can add value**

▪ **Support aggregation of V2G with other technologies (into Virtual Power Plants)**

---
Journey over...or just the beginning?

We hope you've enjoyed this global roadtrip of V2G projects – and that it helps promote awareness of the lessons learned from pioneering pilot projects.

Our parting message is this: there's been much made of the need for cross-vector exchange of knowledge on V2G – strengthening the links between transport and power sectors. But through our work, we've uncovered a need for much more cross-country learning too. This report is our small contribution, but we sense there's much more to come...
